Quantitative Research for Chaplains and Health Care Professionals -

Kevin J. Flannelly 2020-05-21

This book takes readers from very basic research concepts, such as 'causality' and 'variables', to the application of different types of

statistical analyses. The first two chapters introduce the scientific method and causality, and assess the degree to which the major types of research designs used in health care studies allow researchers to make causal inferences. The book concludes with a detailed description of the seven critical factors that must be controlled to draw causal inferences from experimental studies. The rest of the book covers levels of measurement, i.e. nominal, ordinal, interval, and ratio scales; operational definitions; risk factors, independent and dependent variables, and other kinds of variables; how to calculate and interpret measures of central tendency and variability; the normal curve; commonly used measures of association and what they mean; criteria that have been suggested for inferring causality from nonexperimental research; and different types of t-tests. This book provides fundamental and practical knowledge about research methodology that is essential for health care chaplains, and students and professionals in other health care fields and the social sciences. The chapters in this book were originally published as articles in the *Journal of Health Care Chaplaincy*.

[WHO guidance on research methods for health emergency and disaster risk management](#) - 2021-09-30

Health Emergency and Disaster Risk Management (Health EDRM) has recently emerged as a critical field for research, policy, and practice as a result of the growing recognition of health as a core dimension in disaster risk management. Global frameworks such as the WHO 13th General Programme of Work (GPW13), the Sendai Framework for Disaster Risk Reduction 2015-2030, the Sustainable Development Goals (SDGs), and the International Health Regulations (IHR) have goals, targets, and indicators that monitor the health impact of disasters and emergencies and resilience in health systems and communities. Policies and actions guided by the best possible evidence are therefore critical for managing the health risks of emergencies and disasters. However, the evidence base in Health EDRM is very limited, reflecting the overall lack of research in this area. To address this gap, the WHO set out to develop a reference book about methods to guide Health EDRM research in collaboration with global experts. This book provides concrete guidance across a wide range of research, taking a systematic approach

to discuss the type of research that is needed to generate relevant evidence for managing risks and consequences of emergencies and disasters. This research includes observational and experimental studies, and those that use qualitative or quantitative data, or both. When using the book, readers are encouraged to take account of the specific setting of the health risks of any emergency or disaster, including national capacities and the impacts that are directly and indirectly health-related.

As the Magnet Recognition Program® continues to influence hospital-based nursing, the need to educate clinical nurses on how to conduct research is more important than ever. *Establishing a Research-Friendly Environment: A Hospital-Based Approach* is a unique text that helps clinical nurses conduct or participate in research that leads to better health care in hospitals. Each chapter includes an introduction, working definitions of key concepts, and resources required for success. The text also features numerous case examples that serve to highlight research done by nurses and health professionals in the field.
